Definition

Gel diet Breeding is a complete nutritional solution that can be used to both diet and hydrate animals using a single product.

Product Objective

Gel diet Breeding is composed of 73% water and 25% A03 type standard diet. This Gel diet provides a wide range of nutrients: proteins, slow carbohydrates (starch), lipids, vitamins and minerals. It can be used to provide animals with their main nutrients during transport or a stressful situation such as a post-operative period.

Gel diet Breeding can be distributed provisionally (2 to 7 days) to animals in a stressful situation or a recovery phase as a complement to granulated diets.

Directions for use

Distribution period:

- ✓ 1 day before the transport phase for acclimatization, then throughout transport.
- ✓ 72 hours for animals weakened by protocol conditions; replenishment varies depending on cage type (particularly cage ventilation).

Gel diet Breeding can be distributed:

- ✓ Placed directly on the cage floor, in the open package
- ✓ Removed from the packaging and placed directly in the cage dieting dish, or on the cage floor.

Quantity consumed per day: 15-13 g/day for mice, 60 g/day for rats. Daily consumption depends on species and strain.

Distribution method: ad libitum or rationing depending on experimental protocols. Standard diet (e.g. A03 granules) can be kept within animals' reach.

Storage: the product in its closed, original packaging can be stored for 6 months in a dark area at room temperature. Can be stored at 4°C.

After opening, the product can be kept for 5 days maximum.

About this Product

Solid paste with 73% water content, packaged in individual, protectively sealed tubs. Irradiated at 10 kiloGrays.

- ✓ 100 g tub, sold in packs of 60. The tubs are grouped in quantities of 30 in a hermetically sealed envelope
- ✓ a cardboard rack is provided to install your gel diet
