Definition

Gel diet High Fat is a nutrient solution for combining animal hydration and food (high energy) in a single product.

Product Objective

Gel diet High Fat consisting of 61.7% water and protein, carbohydrates rapid (sugar), lipids, vitamins and minerals, fibers, used to provide the major nutrient for animals. Its high content of fat and sugars allows the continuation of a High Fat Diet for animals in difficult situations, such as after surgery after bariatric surgery.

Gel diet High Fat can be distributed transiently (2-15 days) to animals in difficulty or recovery phase in addition to food pellets.

Gel diet High Fat is thermoreversible because liquefies between 70 and 90 ° C.

It is advisable, for rodents, add enrichment to gnaw type Top Brick (ref SAFE).
